

ARM Assembly Programming by Using GAS

Peng-Sheng Chen

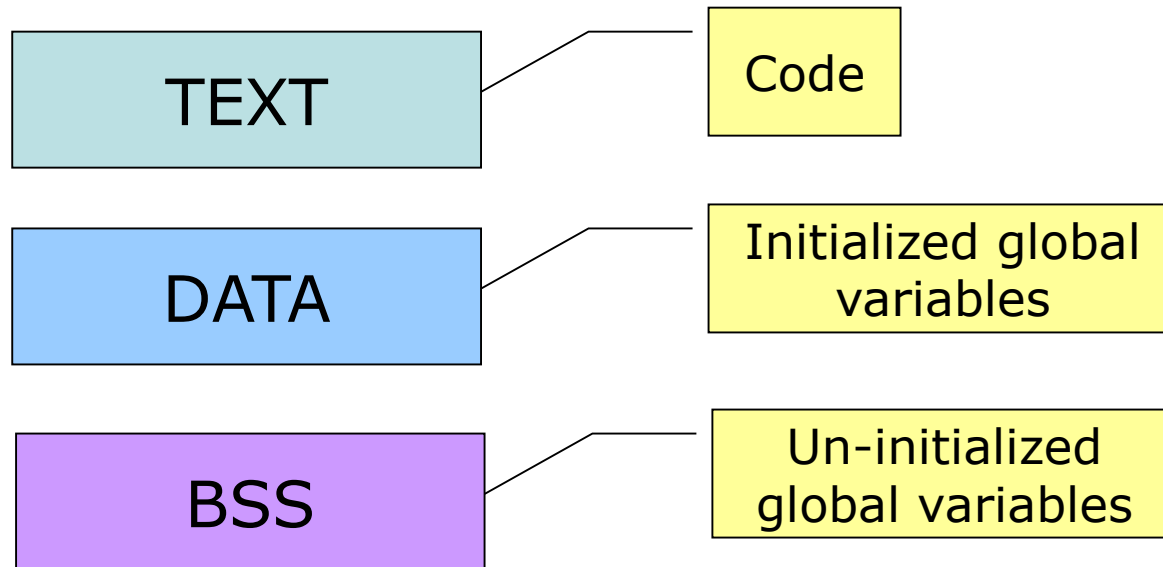

Fall, 2017

Outline

- Object File Format
- GDB & ARM Emulator
- Run Your Program

Object File Format

- COFF (Common Object File Format)
- ELF (Extended Linker Format)
- The segments (sections) in the object file

Basic Format (1)

```
.section .text  
.global main  
.type main,%function  
main:  
    MOV r0, #100  
    ADD r0, r0, r0  
.end
```

Filename: test.s

- Assemble the following code into a section
- Similar to “AREA” in armasm

<http://sourceware.org/binutils/docs-2.23/as/index.html>

Basic Format (2)

```
.section .text  
    .global main  
    .type main,%function  
main:  
    MOV r0, #100  
    ADD r0, r0, r0  
    .end
```

Filename: test.s

- “.global” makes the symbol visible to ld
- Similar to “EXPORT” in armasm

Basic Format (3)

```
.section .text  
    .global main  
    .type main,%function  
main:  
    MOV r0, #100  
    ADD r0, r0, r0  
    .end
```

Filename: test.s

- This sets the type of symbol name to be either a function symbol or an object symbol

- “.end” marks the end of the assembly file
- Assembler does not process anything in the file past the “.end” directive

Basic Format (4)

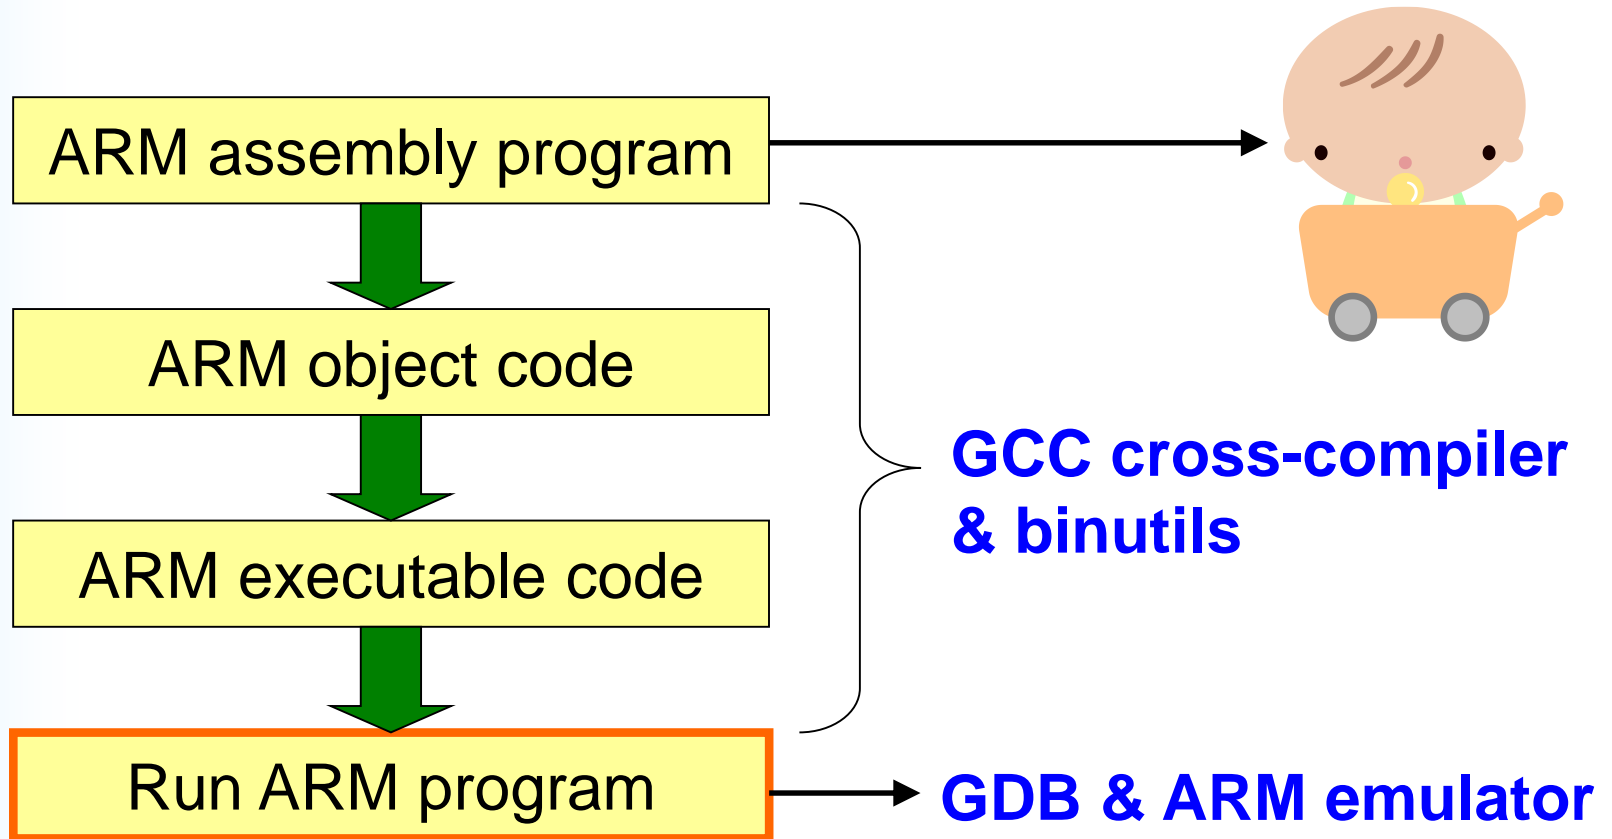

```
.section .text
.global main
.type main,%function
main:
    MOV r0, #100
    ADD r0, r0, r0
.end
```

- LABEL透過 ":" 來做識別
- armasm則是透過指令和保留字的縮排來做識別

Filename: test.s

- Comments
 - /* ...your comments... */
 - @ your comments (line comment)

How to Run a ARM program?

GDB & ARM Emulator

GDB & ARM Emulator

- GNU Debugger, GDB
- GUI GDB
- Cross-debugger & ARM Emulator

GNU Project Debugger (GDB)

- Allows you to see what is going on **`inside'** another program while it executes
 - Start your program, specifying anything that might affect its behavior
 - Make your program stop on specified conditions
 - Examine what has happened, when your program has stopped
 - Change things in your program, so you can experiment with correcting the effects of one bug and go on to learn about another

GDB

- **GDB 8.01** was released at September 7th, 2017
- Debug programs written in
 - C, C++, Fortran, Ada **OK**
 - Modula-2, Pascal Partial
- Official website
 - <http://sourceware.org/gdb/>

Running Programs under GDB

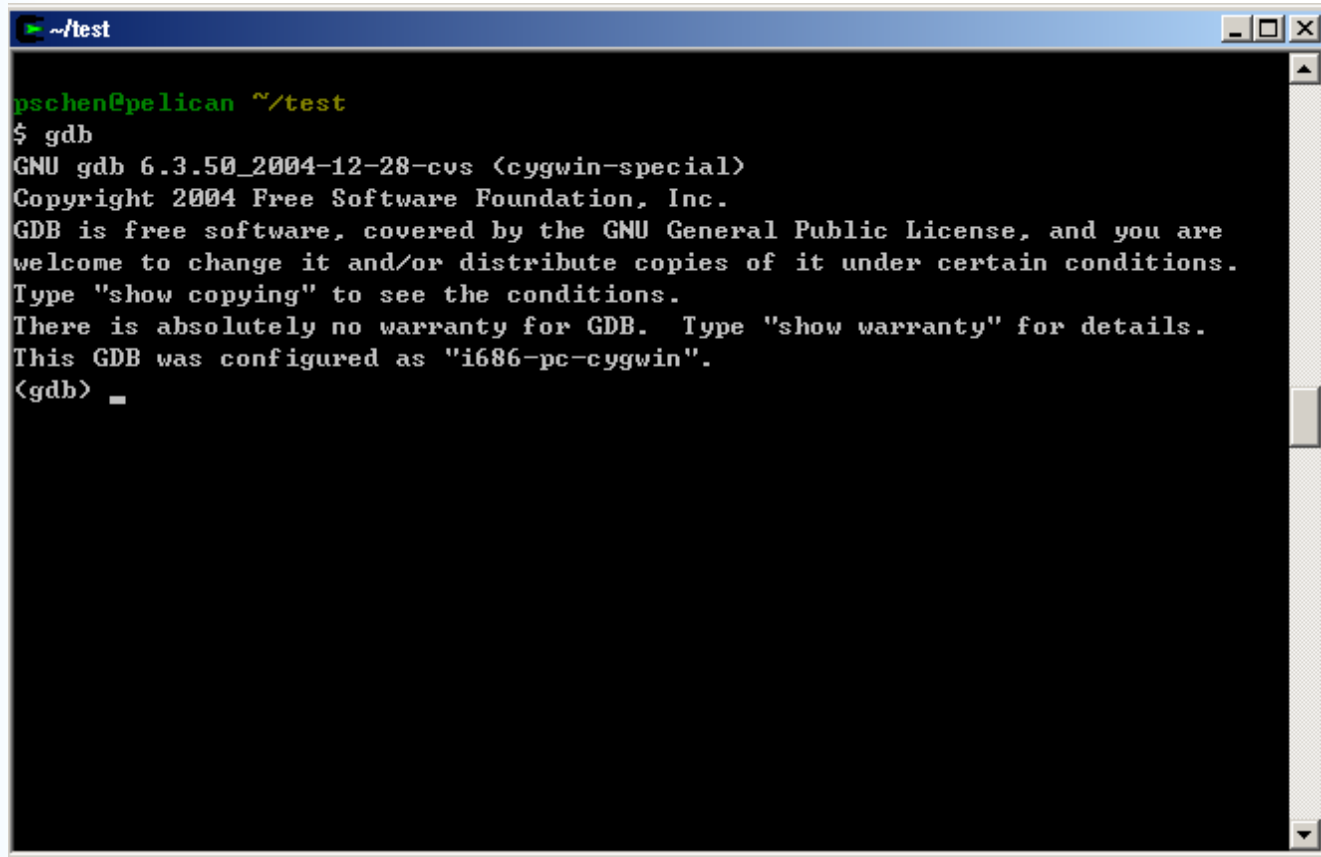

- Compiling for debugging

- Add option “**-g**”

- Add option “**-gdwarf-2**” or “**-g3**” for macro information

Starting GDB

- gdb hello.exe

A screenshot of a terminal window titled '~ /test'. The prompt is 'pschen@pelican ~/test'. The user has entered 'gdb'. The terminal displays the following text: 'GNU gdb 6.3.50_2004-12-28-cvs (cygwin-special)', 'Copyright 2004 Free Software Foundation, Inc.', 'GDB is free software, covered by the GNU General Public License, and you are welcome to change it and/or distribute copies of it under certain conditions. Type "show copying" to see the conditions.', 'There is absolutely no warranty for GDB. Type "show warranty" for details.', 'This GDB was configured as "i686-pc-cygwin".', and the prompt '(gdb) _'.

```
pschen@pelican ~/test
$ gdb
GNU gdb 6.3.50_2004-12-28-cvs (cygwin-special)
Copyright 2004 Free Software Foundation, Inc.
GDB is free software, covered by the GNU General Public License, and you are
welcome to change it and/or distribute copies of it under certain conditions.
Type "show copying" to see the conditions.
There is absolutely no warranty for GDB. Type "show warranty" for details.
This GDB was configured as "i686-pc-cygwin".
(gdb) _
```

Basic Commands (1)

- **target exec** *executable-filename*
- **run** *command-line-arguments*
 - Start your program under GDB
 - **run** test1.exe < foo.txt
- **break** *place*
 - **break** *FUNCTION*
 - Set a breakpoint at entry to function *FUNCTION*
 - **break** *LINENUM*
 - Set a breakpoint at line *LINENUM* in the current source file
 - **break** *FILENAME:LINENUM*
 - Set a breakpoint at line *LINENUM* in source file *FILENAME*
 - ...

Basic Commands (2)

- **file** *executable-filename*
 - Load symbol information
- **step** [COUNT]
 - Continue running your program until control reaches a different source line, then stop it and return control to GDB
- **next** [COUNT]
 - Continue to the next source line in the current (innermost) stack frame. This is similar to `step', but function calls that appear within the line of code are executed without stopping
- **print** [EXP]

For the beginner, it is hard to use

Graphic User Interface to GDB

- It makes GDB easier to use
 - DDD
 - gdbgui (browser-based)
 - Insight
 - Code Medic
 - Others ...

Graphic User Interface

GDB
(command-line mode)

Data Display Debugger (DDD)

- A graphical front-end for command-line debuggers
 - GDB, DBX, WDB, Ladebug, JDB, XDB, the Perl debugger, the bash debugger, the Python debugger
- GNU project
- <http://www.gnu.org/software/ddd/>
- Requirement
 - **X-windows**
 - Motif-like library

DDD: /public/source/programming/ddd-3.2/ddd/cxxtest.C

Build the Cross Debugger

Prepare to Build Cross Debugger

- **Cross compiler, binutils and newlib are ready**
- Download insight source package
 - <ftp://sources.redhat.com:/pub/insight/releases/insight-6.6.tar.bz2>
- Uncompress source package
 - `tar -jxvf insight-6.6.tar.bz2`

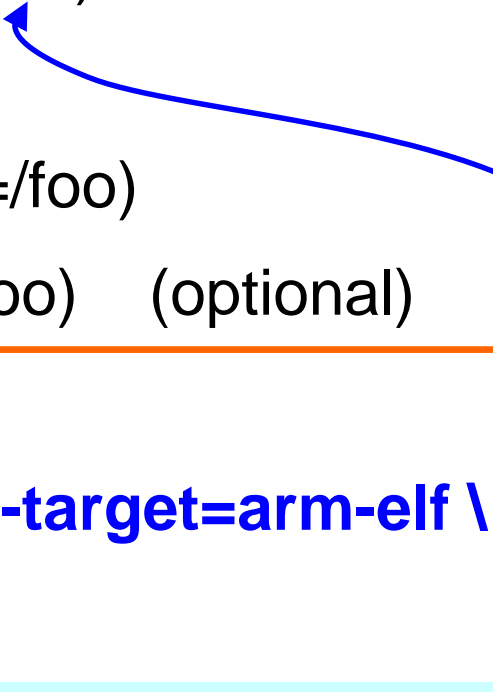

GDB Source Package (1)

- gdb-6.6/configure (and supporting files)
 - script for configuring GDB and all its supporting libraries
- gdb-6.6/gdb
 - the source specific to GDB itself
- gdb-6.6/bfd
 - source for the Binary File Descriptor library
- gdb-6.6/include
 - GNU include files
- gdb-6.6/libiberty
 - Source for the “liberty” free software library
 - It is a collection of subroutines used by various GNU programs.
 - Current members include:
 - `getopt` -- get options from command line
 - `obstack` -- stacks of arbitrarily-sized objects
 - `strerror` -- error message strings corresponding to errno
 - `strtol` -- string-to-long conversion
 - `strtoul` -- string-to-unsigned-long conversion

GDB Source Package (2)

- gdb-6.6/opcodes
 - source for the library of opcode tables and disassemblers
- gdb-6.6/readline
 - source for the GNU command-line interface
- gdb-6.6/**sim**
 - Sources for various simulators
 - ARM
 - MIPS
 - PowerPC
 - M68hc11
 - SH

Build Cross Debugger (1)

- Build cross binutils (`--prefix=/foo`)
 - **Add `/foo/bin` to `PATH`**
 - Build cross compiler (`--prefix=/foo`)
 - Build cross newlib (`--prefix=/foo`) (optional)
 - Configure GDB
 - **`./configure --prefix=/foo --target=arm-elf \`
`--enable-sim`**
 - make
 - make install
- 

“/foo”只是舉例，你應該設定為你可以寫入且希望安裝的目錄路徑

Build Cross Debugger (2)

- Cygwin users

- ~~insight 6.6 is ok ???~~

Try: insight 6.8-1 ??

- Some **bugs** in insight 6.5

- <ftp://sources.redhat.com:/pub/insight/releases/insight-6.4.tar.bz2>

- Download patch [cyg-tcl-sehfix.patch](#) from 課程網頁

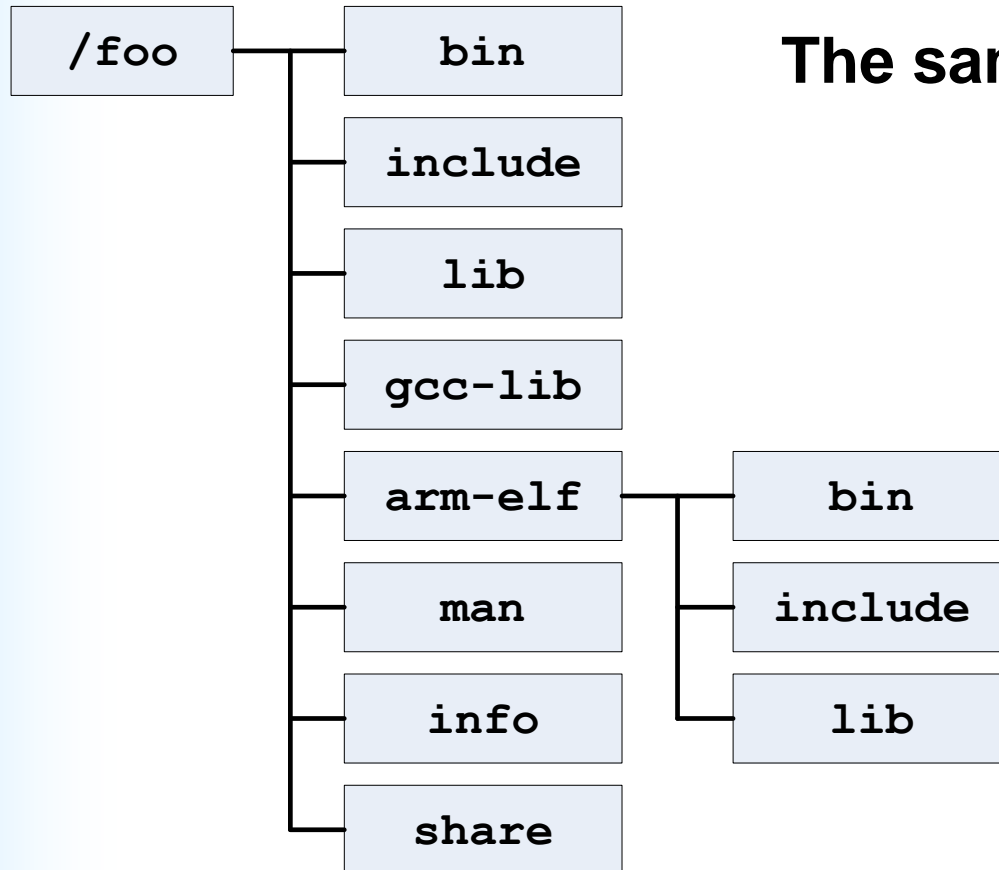

```
% tar -jxvf insight-6.4.tar.bz2
% cd insight-6.4
% patch -p0 < /tmp/cyg-tcl-sehfix.patch
```

(假設**cyg-tcl-sehfix.patch**存放在/tmp目錄下)

Build Cross Debugger (3)

- **--enable-tui**
 - enable full-screen terminal user interface (TUI)
- **--enable-gdbtk**
 - enable gdbtk graphical user interface (GUI)
- **--enable-profiling**
 - enable profiling of GDB
- **--enable-sim**
 - Link gdb with simulator
- **Check GDB document for others**

Directory Structure of GDB

The same with GCC, binutils

Run Insight with ARM Emulator

- Cygwin (Tcl/Tk)：直接執行
- Linux or BSD：需要**X-window**來執行

Practice on Source-Level Debug (1)

- Use cross compiler to compile test.c
 - “-g” option: add debug information which makes possible source-level debug

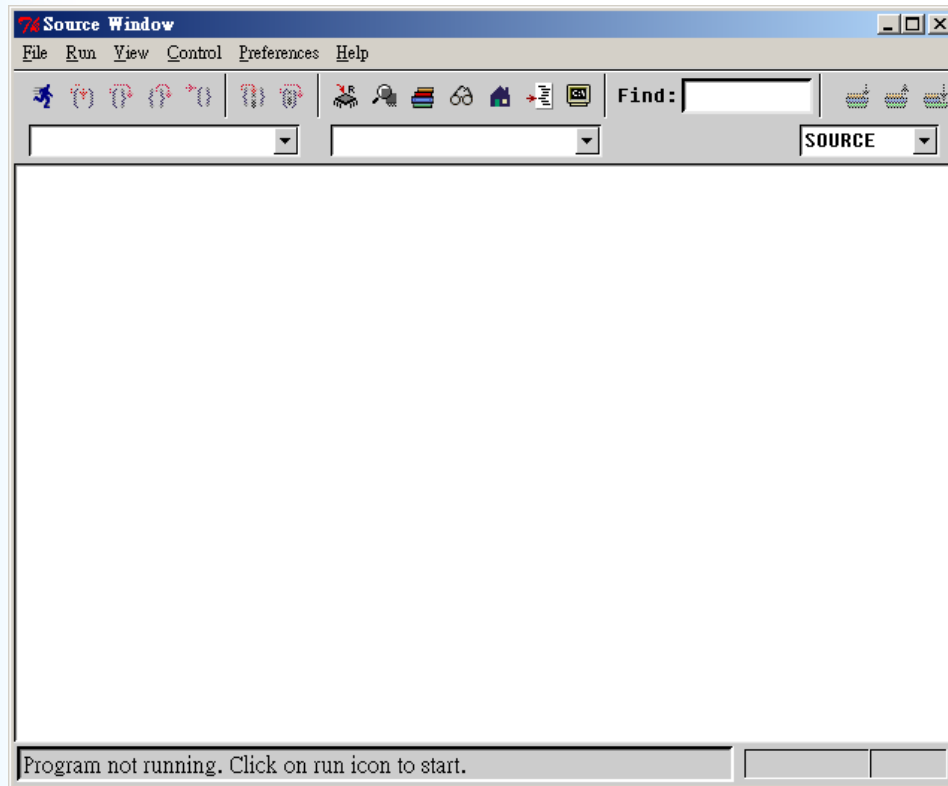

```
% /foo/bin/arm-elf-gcc -g test1.c -o test1.exe
```

Practice on Source-Level Debug (2)

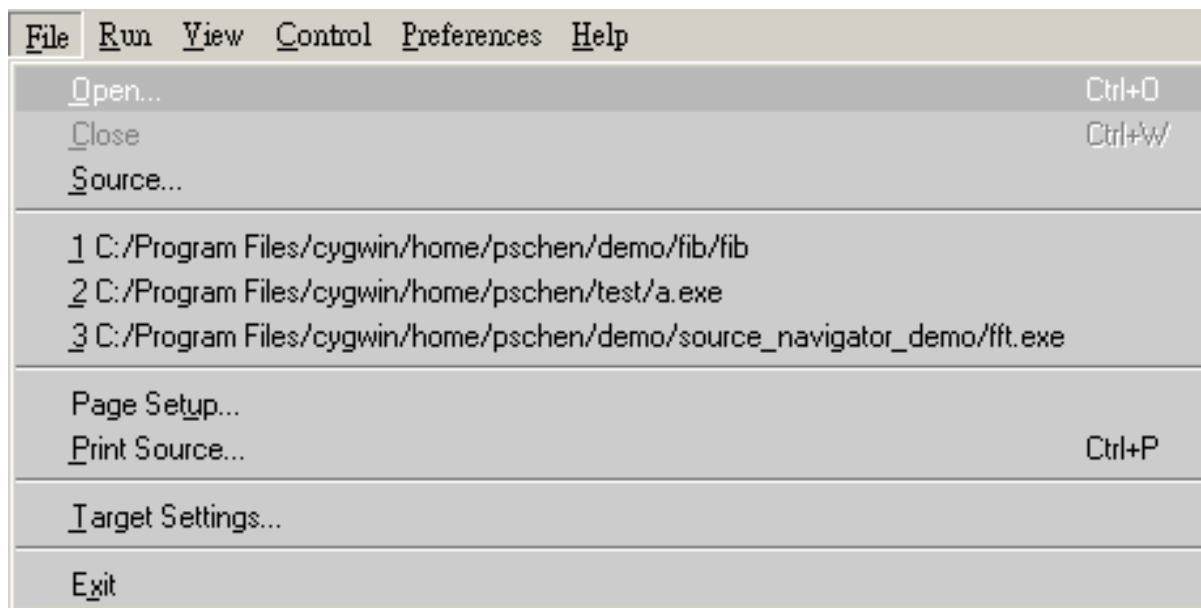

- **Local side:** Run **insight** (GUI of GDB)

```
% /foo/bin/arm-elf-insight
```

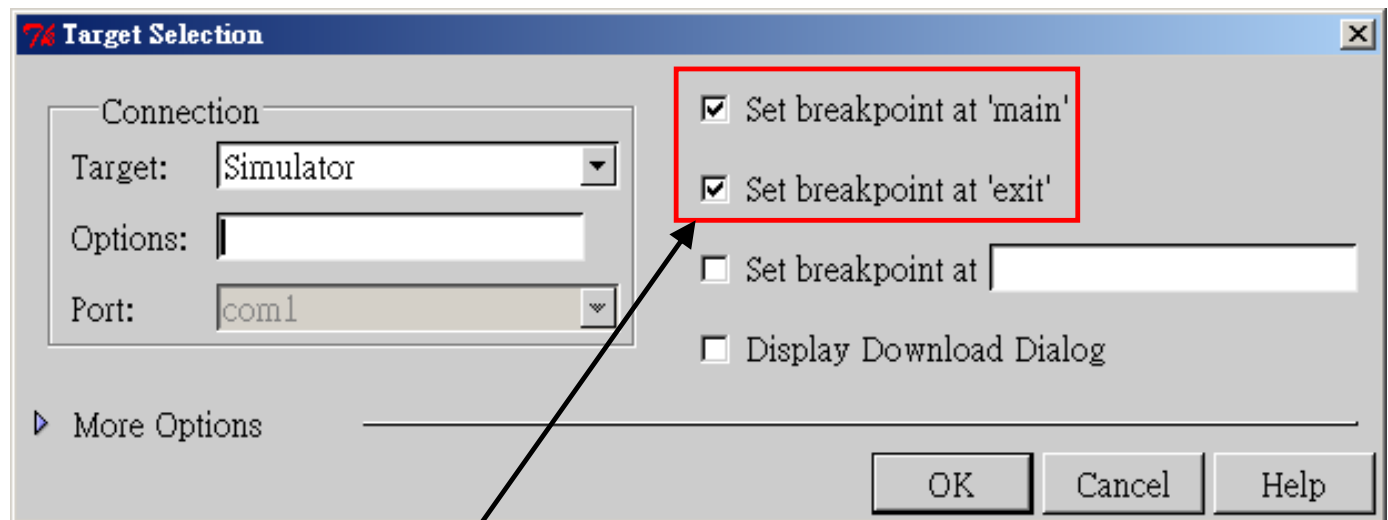

Practice on Source-Level Debug (3)

- **Local side:** Load file: test.exe
 - Select menu: File -> Open
 - Load the program we want to debug

Practice on Source-Level Debug (4)

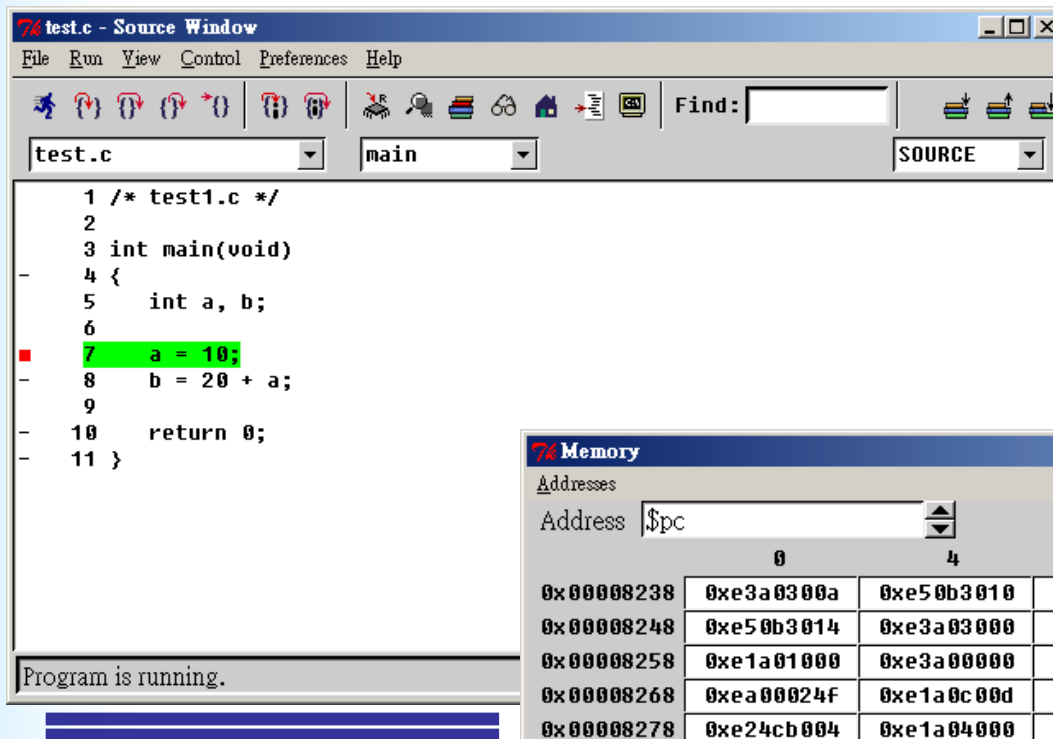

- **Local side:** Set target machine to simulator
 - Select menu: File -> Target Settings
 - Set **Target** to **ARM simulator**

Set breakpoint at “main” and “exit”

Practice on Source-Level Debug (5)

- **Local side:** Begin to do source-level cross debug on ARM simulator
 - Select menu: RUN-> Run
 - Begin to debug

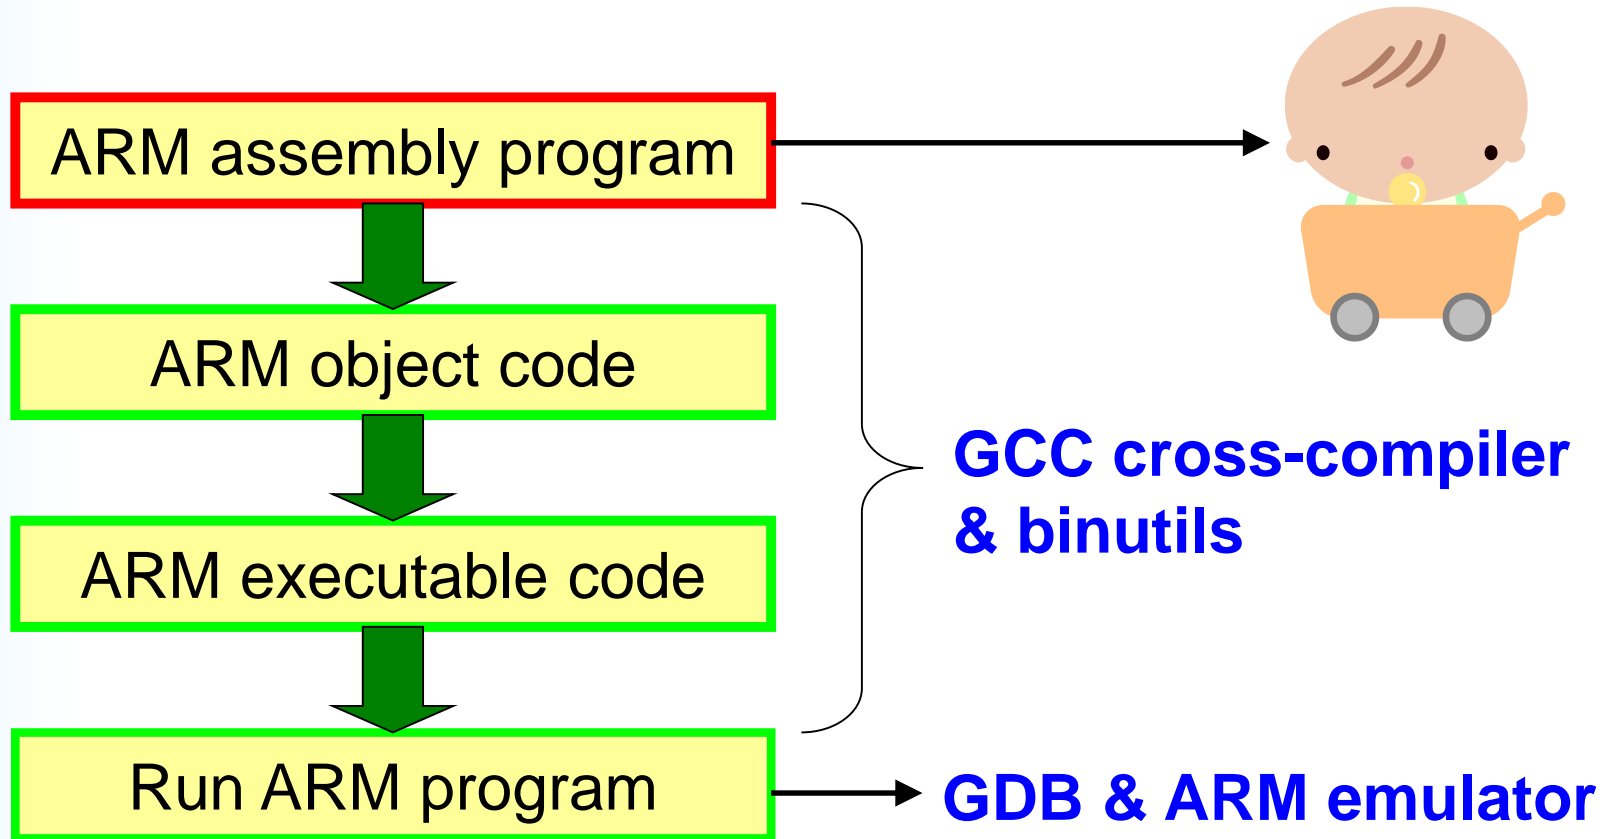

The Registers window shows the state of ARM registers. The 'Group' is set to 'all'. The registers are listed in a table with columns for register name, value, and name.

Register	Value	Name
r0	0x2	f0
r1	0x1ffff4	f1
r2	0xffffffff	f2
r3	0x0	f3
r4	0x2	f4
r5	0x1ffff4	f5
r6	0x0	f6
r7	0x0	f7
r8	0x0	f8
r9	0x0	f9
r10	0x200100	fp
r11	0x1ffffc	sp
r12	0x1ffff0	lr
pc	0x8238	pc

The Memory window shows the state of memory. The 'Address' is set to \$pc. The memory is displayed in a table with columns for address, hex value, and ASCII value.

Address	0	4	8	C	ASCII
0x00008238	0xe3a0300a	0xe50b3010	0xe51b3010	0xe2833014	.0...0...0...0..
0x00008248	0xe50b3014	0xe3a03000	0xe1a00003	0xe91ba800	.0...0.....
0x00008258	0xe1a01000	0xe3a00000	0xe1a02000	0xe1a030000..
0x00008268	0xea00024f	0xe1a0c00d	0xe92dd810	0xe3a01000	0.....-.....
0x00008278	0xe24cb004	0xe1a04000	0xeb00027d	0xe59f3020	..L..@...}...0..

How to Run a ARM program?

Program Execution (1)

- 編譯你的程式

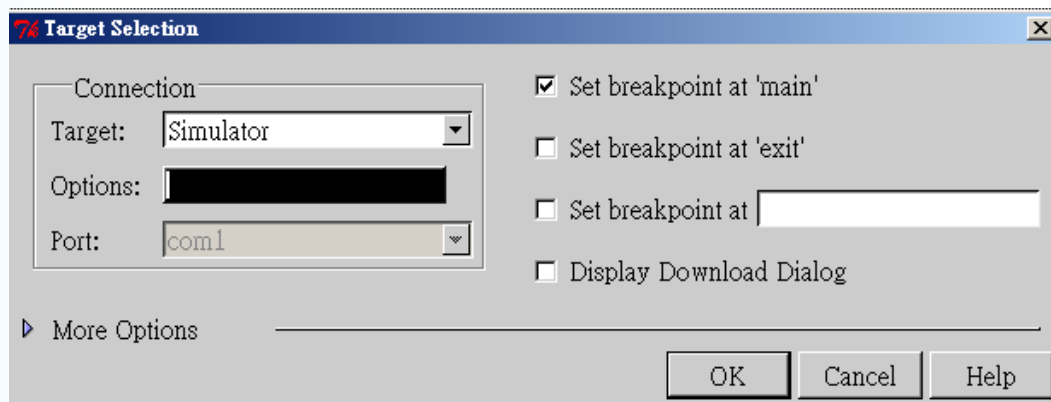

```
% arm-elf-gcc -g -O0 test.s -o test.exe
```

- 執行debugger & emulator

```
% arm-elf-insight
```

– Select execution model:

- File -> Target Settings... -> simulator

Program Execution (2)

test.s - Source Window

File Run View Control Preferences Help

test.s main SOURCE

```
1      .section .text
2      .global main
3      .type main,%function
4 main:
5      MOV r0, #100
6      ADD r0, r0, r0
```

Group: all

r0	0x0	f0	0
r1	0x0	f1	0
r2	0x0	f2	0
r3	0x0	f3	0

lr	0x0		
pc	0x0		

Program stopped at line 5

.type name, type description

- **type description**
 - **function**: Mark the symbol as being a function name.
 - **object**: Mark the symbol as being a data object.
 - **common**: Mark the symbol as being a common data object.

Example (1)

```
/* ===== */
/*      DATA section      */
/* ===== */

.data

/* --- variable a --- */
.type a, %object
a:
    .word 1
    .word 2

/* --- variable b --- */
.type b, %object
b:
    .word 3

/* --- variable c --- */
.type c, %object
c:
    .space 8, 0
```

$$a = \begin{bmatrix} 1 & 2 \end{bmatrix}$$

$$b = \begin{bmatrix} 3 \end{bmatrix}$$

$$c = b \times a$$

$$c = \begin{bmatrix} ? & ? \end{bmatrix}$$

Example (1)

```
/* ===== */
/*      DATA section      */
/* ===== */

.data

/* --- variable a --- */
a:
    .word 1
    .word 2

/* --- variable b --- */
b:
    .word 3

/* --- variable b --- */
c:
    .space 8, 0
```

$$a = \begin{bmatrix} 1 & 2 \end{bmatrix}$$

$$b = \begin{bmatrix} 3 \end{bmatrix}$$

$$c = b \times a$$

$$c = \begin{bmatrix} ? & ? \end{bmatrix}$$

Example (2)

```
/* ===== */
/*      TEXT section      */
/* ===== */
```

```
.section .text
.global main
.type main,%function
```

```
.matrix:
```

```
.word a
.word b
.word c
```

```
main:
```

```
ldr r0, .matrix
ldr r1, [r0], #4    /* r1 := mem32[r0] */
/* r0 := r0 + 4    */
```

```
ldr r2, [r0]
```

```
ldr r0, .matrix + 4
ldr r3, [r0]        /* r3 := mem32[r0] */
```

```
ldr r4, .matrix + 8
```

```
mul r5, r3, r1
mul r6, r3, r2
```

```
str r5, [r4], #4    /* mem32[r4] := r5 */
/* r4 := r4 + 4    */
```

```
str r6, [r4]
nop
```

抓到a的地址，放入r0

抓到第一个a的值

抓到第二个a的值

Example (2)

```
/* ===== */
/*          TEXT section          */
/* ===== */
```

```
.section .text
.global main
.type main,%function
```

```
.matrix:
```

```
.word a
.word b
.word c
```

```
main:
```

```
ldr r0, .matrix
ldr r1, [r0], #4    /* r1 := mem32[r0] */
                  /* r0 := r0 + 4 */
ldr r2, [r0]
```

```
ldr r0, .matrix + 4
ldr r3, [r0]        /* r3 := mem32[r0] */
```

```
ldr r4, .matrix + 8
```

```
mul r5, r3, r1
mul r6, r3, r2
```

```
str r5, [r4], #4    /* mem32[r4] := r5 */
                  /* r4 := r4 + 4 */
```

```
str r6, [r4]
```

```
nop
```

抓到b的地址，放入r0

抓到第一个b的值

抓到c的地址，放入r4

Example (2)

```
/* ===== */
/*      TEXT section      */
/* ===== */
```

```
.section .text
.global main
.type main,%function
```

```
.matrix:
```

```
.word a
.word b
.word c
```

```
main:
```

```
ldr r0, .matrix
ldr r1, [r0], #4    /* r1 := mem32[r0] */
                  /* r0 := r0 + 4    */
```

```
ldr r2, [r0]
```

```
ldr r0, .matrix + 4
ldr r3, [r0]        /* r3 := mem32[r0] */
```

```
ldr r4, .matrix + 8
```

```
mul r5, r3, r1
mul r6, r3, r2
```

```
str r5, [r4], #4    /* mem32[r4] := r5 */
                  /* r4 := r4 + 4    */
```

```
str r6, [r4]
```

```
nop
```
